

AI-Powered Workplace Productivity Assistant

1–2 Page Project Documentation

Prepared by: Aamina Mongwe **Date:** 17 September 2026

Problem Statement

Professionals spend significant time on repetitive workplace activities such as drafting emails, summarizing meetings, organizing tasks and researching information. This can reduce time available for higher-value work and may cause inconsistent outputs or missed action items.

Solution Overview

The proposed AI-Powered Workplace Productivity Assistant combines five functions: Smart Email Generator, Meeting Notes Summarizer, AI Task Planner, AI Research Assistant and AI Chatbot. Users provide context, the assistant generates a structured result, and the user reviews and validates it before use.

Tools Used

ChatGPT or another approved generative AI platform for language processing; PowerPoint for the prototype demonstration and presentation; Word/PDF for documentation; and optionally a no-code/web interface for an interactive prototype.

Sample Prompts

Email: "Draft a formal email to my manager requesting a deadline extension. Use only the facts provided." Meeting: "Extract summary, decisions, action items, owners and deadlines. Mark missing information as 'Not specified'." Planner: "Prioritize these tasks by urgency and importance and create a realistic schedule." Research: "Summarize the supplied material and identify key insights, evidence and limitations."

Challenges and Solutions

AI can hallucinate, be too generic or omit details. Structured prompts, explicit constraints, source-based inputs, output templates and human verification reduce these risks. Privacy is addressed by minimizing confidential information and following workplace AI policies.

Expected Impact

The assistant is intended to reduce repetitive effort, improve consistency and help users organize information more quickly. Productivity gains should be measured through prototype testing by comparing manual and AI-assisted completion time and quality.

Responsible AI

AI output must be reviewed before professional use. Users should verify important facts, dates, names, deadlines and decisions. Confidential information should not be entered unless permitted by organizational policy. The assistant

should clearly communicate uncertainty and should not invent missing information.
